ABSTRACT

An automobile compact fuse holder comprising: a small plate including at
least two protective circuits, each one of them comprising a resettable fuse
consisting in a positive temperature coefficient element (PTC) connected to two
terminals, being each pair of terminals of each protective device connected to a light
signal generating element, wherein each protective circuit has two input and output
connectors, and said each pair of terminals are additionally connected to a sole
second light signal disposed on the small plate. Additionally, said each pair of
terminals are connected to an audible signal generating circuit. The positive
temperature element (PTC) is one of a polymeric, ceramic, thermistor, bimetallic
type. The light signal generating element is selected from an electric bulb or lamp,
a diode and a biode, and the input and output connectors of each protective circuit,
may be all male, all female or male-female.
